

## **ABSTRACT**

A massage device for creating a massaging action. The massage device may include at least two massaging projections mounted in relation to a flexible fluid supply conduit, such as a shower hose. The device may include a chamber for containing an impeller, and the fluid supply  
5 conduit may include an outlet for fluid to contact the impeller and cause the impeller to rotate. At least one weight is disposed in the head and is coupled to the impeller eccentric to a rotational axis of the impeller for moving the projection in an oscillatory motion, which creates the massaging action. The head may be supplied on a handle, or along the fluid supply conduit.
